### Project summary and goals

FIBFlow (Financial Intelligent Business Flow) is an initiative by Tech Remote Hub, Moneris and Fraunhofer Portugal AICOS to address technological gaps in the accounting and financial management sectors. The project aims to replace disconnected workflows and manual processes with a platform that centralizes and automates financial operations. To achieve this, FIBFlow focuses on the following objectives:

- Automated Accounting  
Recommendations: Provide an automated way of suggesting accounting entries without manual rule configuration, allowing the system to scale across thousands of distinct client profiles.
- Advanced Analytics and Risk Management: Combine historical data with current micro and macro indicators to predict performance, improving budget planning and proactive risk management.
- Compliance monitoring: Automate customer profiling to strengthen

continuous compliance with legal and anti-money laundering standards.

Overall, the project is expected to increase operational efficiency, reduce manual workload, and enable professionals to focus on higher-value tasks.
